

Ex 1.

Struktur 1:

Hvis vi splitter filteret i to dele bliver det lettere. Vi finder først overføringsfunktioner $W(z)/X(z)$:

$$w[n] = (w[n-2] \cdot (-d_2) + w[n-1] \cdot (-d_1) + x[n]) d_0$$

Z-transform:

$$\Rightarrow W(z) (1 + \bar{z}^{-1} d_1 d_0 + \bar{z}^{-2} d_2 d_0) = X(z) d_0$$

$$\Rightarrow \frac{W(z)}{X(z)} = \frac{1}{1/d_0 + \bar{z}^{-1} d_1 + \bar{z}^{-2} d_2}$$

Vi finder så for $Y(z)/W(z)$:

$$y[n] = w[n-2] c_2 + w[n-1] c_1 + w[n] c_0$$

z-transform gir:

$$Y(z) = (c_2 z^{-2} + c_1 z^{-1} + c_0) W(z)$$

$$\Rightarrow \frac{Y(z)}{W(z)} = c_2 z^{-2} + c_1 z^{-1} + c_0$$

Dette gir

$$\frac{Y(z)}{X(z)} = \frac{Y(z)}{W(z)} \cdot \frac{W(z)}{X(z)} = \frac{c_2 z^{-2} + c_1 z^{-1} + c_0}{\frac{1}{d_0} + d_1 z^{-1} + d_2 z^{-2}}$$

Som er lik $G(z) = \frac{Y(z)}{X(z)}$

$$b(s)X = (b_2 s^2 + b_1 s + 1) (s)W \Leftrightarrow$$

$$b_2 s^2 + b_1 s + 1 = \frac{(s)W}{(s)X} \Leftrightarrow$$

$$: (s)W / (s)X$$

$$b_2 [n]W + b_1 [1-n]W + 1 [1-n]W = [n]p$$

Struktur 2:

Denne struktur er helt lik som struktur 1 bortsett fra at siste og første del er byttet om. Hvis vi igjen kaller midtpunktet $w[n]$, kan vi skrive:

$$\frac{W(z)}{X(z)} = C_2 \bar{z}^{-2} + C_1 \bar{z}^{-1} + C_0$$

$$\frac{Y(z)}{W(z)} = \frac{1}{1/d_0 + \bar{z}^{-1}d_1 + \bar{z}^{-2}d_2}$$

Dette gir oss altså samme filter som $G(z)$

Struktur 3:

Vi skriver ned likningene:

$$(X[n]C_0 + C_2 X[n-2] + C_1 X[n-1] - y[n-1]d_1 - y[n-2]d_2) \cdot d_0 = y[n]$$

Vi skriver om:

$$X[n]C_0d_0 + X[n-2]C_2d_0 + X[n-1]C_1d_0 = y[n-1]d_1d_0 + y[n-2]d_2d_0 + y[n]$$

Z-transformen or alle blir:

$$X(z) \left(c_0 + c_1 \bar{z}^{-1} + c_2 \bar{z}^{-2} \right) = Y(z) \left(\frac{1}{d_0} + d_1 \bar{z}^{-1} + d_2 \bar{z}^{-2} \right)$$

$$\Rightarrow \frac{Y(z)}{X(z)} = \frac{c_0 + c_1 \bar{z}^{-1} + c_2 \bar{z}^{-2}}{\frac{1}{d_0} + d_1 \bar{z}^{-1} + d_2 \bar{z}^{-2}}$$

Samme som $G(z)$

Ex. 2

1.)

a) Jeg splitter opp systemet slik.

Da kan jeg skrive:

$$w[n] = x[n] + \frac{1}{3} w[n-1]$$

$$y[n] = (2x[n] + w[n]) \cdot 3 + w[n-1] \cdot 6$$

$$\Rightarrow y[n] = 6x[n] + 3w[n] + 6w[n-1]$$

Hvis vi tar z-transformen får vi:

$$W(z) = X(z) + \frac{1}{3} W(z) z^{-1} \quad (1)$$

$$Y(z) = 6X(z) + 3W(z) + 6W(z) z^{-1}$$

$$\Rightarrow Y(z) = 6 \left(W(z) - \frac{1}{3} W(z) z^{-1} \right) + 3W(z) + 6W(z) z^{-1}$$

Setter inn for ①

$$= 6W(z) - 2W(z) z^{-1} + 3W(z) + 6W(z) z^{-1}$$

$$Y(z) = (9 + 4z^{-1}) W(z)$$

Videre for ① har vi:

$$W(z) = X(z) \frac{1}{1 - \frac{1}{3}z^{-1}}$$

Dette gir

$$\frac{Y(z)}{X(z)} = \frac{9 + 4z^{-1}}{1 - \frac{1}{3}z^{-1}}$$

Vi driver så:

$$Y(z) - \frac{1}{3}z^{-1} Y(z) = X(z) 9 + X(z) 4z^{-1}$$

Dette gir oss:

$$\underline{\underline{y[n] - \frac{1}{3}y[n-1] = 9x[n] + 4x[n-1]}}$$

b) Vi ser hva $y[n]$ blir hvis:

$$x[n] = \begin{cases} 1 & n=0 \\ 0 & \text{ellers} \end{cases}$$

Vi har at $y[n] = 9x[n] + 4x[n-1] + \frac{1}{3}y[n-1]$

$$\Rightarrow y[0] = 9 \cdot 1 + 0 = 9$$

$$y[1] = 9 \cdot 0 + 4 + \frac{9}{3} = 7$$

$$y[2] = 9 \cdot 0 + 4 \cdot 0 + \frac{7}{3} = \frac{7}{3}$$

$$y[3] = \frac{7}{3^2}$$

$\vdots$

$$y[n] = \frac{7}{3^{n-1}} = \frac{7}{3^n 3^{-1}} = \frac{21}{3^n}$$

Vi ser at ved $n=0$ gjelder ikke denne formelen. Så vi må skrive:

$$\underline{\underline{h[n] = \delta[n] \cdot 9 + \frac{21}{3^n} u[n-1]}}$$

Exercise 4

Hele opgaven er gjort i Python, se kode og plot under.
